Skills

Agents and AI

MCP servers, clients and OAuth 2.1, Vercel AI SDK, Amazon Bedrock, Claude Code, Codex, agent orchestration

Languages

TypeScript, Node.js, Java, Kotlin, SQL

Cloud and infrastructure

Kubernetes, AWS (ECS Fargate, Lambda, RDS, S3, KMS, SSM, VPC), Pulumi, Terraform, Docker

Data

PostgreSQL, Kysely, MySQL, Oracle

Frontend

React, Backstage, Vite, Vue.js

Education

Lapland University of Applied Sciences, 2006 - 2011
Bachelor of Software Engineering

Thesis: an automated poker player in C++ and the security of online poker. Grade 5/5.

Nokia Siemens Networks scholarship (2007)

Exchange studies
Missouri State University, 2008
Shanghai University, 2009

Certifications

AWS Solutions Architect Professional, 2019

AWS Solutions Architect Associate, 2019

PROFILE

Software engineer with 15 years of production experience, from hands-on development to leading engineering at Roadie, where I joined as a founding engineer in 2021. I work best on platforms that other engineers build on, and I care as much about build pipelines, deployment and the boundaries between systems as about the features on top. My focus now is measuring and containing AI agents: grading their work against real outcomes, and keeping credentials and untrusted input away from the model. I am looking for a staff or principal IC role on an agent platform, where my leadership background helps set the quality bar for the teams building on it.

WORK EXPERIENCE

Roadie, remote | 2021 - present

Head of Engineering | 2024 - present

- Lead engineering for Roadie, a SaaS developer platform built on Backstage.
- Shipped openroadie, a self-hosted context store and agent control platform: JSONata-based ingestion workflows, a catalog datastore with inferred JSON schemas and a rules-driven relationship graph, and an MCP server that exposes the graph and its write actions to agents.
- Set the direction for Roadie's AI work as a series of small, timeboxed bets, each measured for feasibility and infrastructure cost before committing a team to it.

Founding Engineer (employee #5) | 2021 - 2024

- Built the Roadie product with the founding team: a multi-tenant SaaS platform hosting Backstage for customers on AWS and Kubernetes. It has held four nines of uptime or better every year since December 2021.
- Designed and built Tech Insights for the Backstage open-source project, from the RFC to the initial implementation: data sources that collect facts, checks over those facts, and scorecards that combine checks across a catalog. Then built Roadie's product on top of it.
- Profiled and tuned the backend and catalog for tenants with over 100,000 entities.
- Built roadie-agent, the library customers use to extend Roadie from inside their own networks.
- Co-maintain 50+ open-source Backstage plugins and libraries on npm, around 960,000 downloads a month.

Visma Labs, Dublin, Ireland | 2019 - 2021

Software Architect

- Planned and led the migration from a monolith to a modular monolith and microservices.
- Moved workloads from VMs to containers and owned the frontend and backend build pipelines.

Talks and writing

"What is This Tech Insights Anyways?", BackstageCon North America 2022, Detroit, co-located with KubeCon. With Irma Solakovic.

Full-stack Kotlin development, video course, Packt (2017)

Ran the Kotlin meetup in Dublin, 2017 - 2018

Technical blog at jussi.hallila.com since 2016

Languages

Finnish (native), English (fluent), Dutch (B1+)

- Advised development teams on technical approach, architecture guidelines and process.

VSWare, Dublin, Ireland | 2017 - 2019

Head of Frontend Engineering

- Led customer-facing development and user experience for a school administration platform, managing a team of 18 developers.
- Architected the migration from a jQuery/JSP frontend to a modular Vue.js single-page app.

Brandtone, Dublin, Ireland | 2015 - 2017

Senior Software Engineer

- Led development of the core capabilities of the company's largest product, a mobile marketing platform.
- Introduced DevOps practice: Ansible, configuration in source control, chat-ops and an automated Jenkins deployment pipeline. Built the automated testing setup and its infrastructure.
- Moved the frontend to React, Webpack and the Node.js toolchain.

Earlier roles | 2009 - 2015

- **Liberty IT**, Dublin, Software Engineer (2014 - 2015): SOA web services that calculate insurance rates.
- **Unique Digital**, Dublin, Software Developer (2014): Vaadin views and UI components for cinema software, with cross-browser multimedia support.
- **IBM**, Dublin, BI Software Developer (2011 - 2014): business intelligence for IBM delivery centres in EMEA and the US on Java, Spring and Spring Batch. Introduced continuous integration and automated testing.
- **CERN**, Geneva, Web Developer and DBA (2009): database and web frontend for the TOTEM experiment.

PROJECTS

- **Viberglass** (2026, AGPL-3.0, github.com/Ilities/viberglass): open-source, self-hosted workspace where people and coding agents work on the same tasks. An agent plans the change, asks the right person when it is unsure, and opens a pull request once the team has reviewed the plan. Runs eight coding agent CLIs, including Claude Code and Codex, on Docker, Kubernetes, ECS Fargate or Lambda, and can start and scale to zero a vLLM GPU container for self-hosted models. Integrates with Slack, GitHub, Jira and Shortcut. TypeScript monorepo, Helm chart and Pulumi stacks.
- **openroadie** (2026, built at Roadie): a self-hosted context store and agent control platform. Keeps a live, permissioned graph of services, teams and dependencies that agents query and act on over MCP.
- **ctxpack** (2025): an early MCP gateway. Bundles tools, prompts and resources into context packs and deploys them to Claude, ChatGPT or any MCP client over OAuth 2.1.
- **local-ctx** (2025): exposes local stdio MCP servers as OAuth-secured endpoints for web clients.
- **NERD stack** (2015): a Node.js, Express, React and database application skeleton with server-side rendered React, from before isomorphic React was common.
